## 3

It is an object of the present invention to provide compounds having improved fungicidal activity.

We have found that this object is achieved by the compounds defined at the outset. Furthermore, we have found processes for their preparation, compositions comprising them and methods for controlling phytopathogenic fungi using the compounds I.

The present Invention further provides a process for the preparation of compounds of formula I as defined above which comprises treating a compound of formula IV

in which L, m and X are as defined in formula I; with an alcohol, amine or thiol of formula V

in which R<sup>1</sup> and Y are as defined in formula I, and M represents a hydrogen atom or a free or complexed metal atom, to produce compounds of formula I.

For the preparation of the compounds wherein Y represents O, S or NR<sup>2</sup>, M is preferably a hydrogen atom or a alkali metal.

30 For the preparation of the compounds wherein Y represents a single bond, M represents a free or complexed metal atom, such as for example Li, Mg or Zn in the presence of a transition metal, in particular Cu.

35 Compounds of formula IV are novel and can be prepared by reacting 5-amino-pyrazole with 2-phenyl-substituted malonic acid ester of formula II,

wherein L and m are as defined for formula I, R represents alkyl, preferably C<sub>1</sub>-C<sub>6</sub>-alkyl, in particular methyl or ethyl, under alkaline conditions, preferably using high boiling tertiary amines as for example tri-n-butylamine as disclosed for example by EP-A 770 615.

4

The resulting 5,7-dihydroxy-6-phenyl-pyrazolopyrimidine of formula III

5

III

wherein L and m are as defined for formula I, is subsequently treated with a halogenating agent, preferably with a brominating or chlorinating agent, such as phosphorus oxybromide or phosphorus oxychloride, neat or in the presence of a solvent to give IV.

If phosphorus oxybromide or phosphorus oxychloride is used for the halogenation of III the presence of a mineralic acid, such as polyphosphoric acid, and pyridinium salts, preferably pyridinium halides, such as pyridinium bromide or chloride, is preferred.

The reaction is suitably carried out at a temperature in the range from 0 °C to 150 °C, the preferred reaction temperature being from 80 °C to 125 °C as disclosed for example by EP-A 770 615.

The compounds of formula II are preferably prepared by reaction of the corresponding substituted bromobenzenes with sodium dialkylmalonates in the presence of a copper(I) salt, [e.g. Chemistry Letters, pp. 367-370, 1981].

Compounds of formula IVA are particularly preferred.

30

IVA

Accordingly, the Invention relates to the novel intermediates of formula IV, in particular 5,7-dichloro-6-(2,4,6-trifluorophenyl)pyrazolo[1,5-a]pyrimidine and 5,7-dichloro-6-(2-chloro-6-fluorophenyl)pyrazolo[1,5-a]pyrimidine, and to the corresponding 5,7-dihydroxy-6-phenyl-pyrazolo[1,5-a]pyrimidines of formula III.

40

The reaction between the 5,7-dihalogen-6-phenyl-pyrazolopyrimidines of formula IV and the compound of formula V, wherein Y is O, S or NR<sup>2</sup>, is preferably carried out in the presence of an inert solvent.

45

## 5

Suitable solvents include ethers, such as dioxane, diethyl ether and, especially, tetrahydrofuran, halogenated hydrocarbons such as dichloromethane and aromatic hydrocarbons, for example toluene.

5

The reaction is suitably carried out at a temperature in the range from 0 °C to 70 °C, the preferred reaction temperature being from 10 °C to 35 °C.

- 10 It is also preferred that the reaction is carried out in the presence of a base. Suitable bases include tertiary amines, such as triethylamine, and inorganic bases, such as potassium carbonate or sodium carbonate. Alternatively, an excess of the compound of formula V may serve as a base.

15

The reaction between the 5,7-dihalogen-6-phenyl-pyrazolopyrimidines of formula IV and the compound of formula V, wherein Y represents a single bond, is conveniently carried out in the presence of a solvent.

20

Suitable solvents include ethers, such as dioxane, diethyl ether and, especially, tetrahydrofuran, hydrocarbons such as hexane, cyclohexane or mineral oil, and aromatic hydrocarbons, for example toluene, or mixtures of these solvents.

25

The reaction is suitably carried out at a temperature in the range from -100 °C to +100 °C, the preferred reaction temperature being from -80 °C to +40 °C.

- 30 It is also preferred that the reaction is carried out in the presence of copper ions, preferably equimolar amounts of copper(I) halides, in particular copper(I) iodide.

- Furthermore the compounds of formula I, wherein Y represents a single bond may be prepared by reacting the corresponding alkyl 2-aryl-3-alkyl-3-oxopropionates of formula VI

40

VI

in which R¹, L and m have the meaning given and R' represents an optionally substituted alkyl group, preferably C₁-C₄-alkyl, with 5-amino-pyrazole.

45

## 6

The reaction mixtures are worked up in a customary manner, for example by mixing with water, phase separation and, if required, chromatographic purification of the crude products. Some of the intermediates and end products are obtained in the form of colorless or slightly brownish, viscous oils, which are purified or freed from volatile components under reduced pressure and at moderately elevated temperatures. If the intermediates and end products are obtained as solids, purification can also be carried out by recrystallization or digestion.

10

If individual compounds I are not obtainable by the routes described above, they can be prepared by derivatization of other compounds I.

15 However, if the synthesis yields isomer mixtures, a separation is generally not necessarily required since in some cases the individual isomers can be converted into one another during the preparation for use or upon use (for example under the action of light, acids or bases). Similar conversions may also occur after use, for example in the treatment of plants in the treated plant or in the harmful fungus or animal pest to be controlled.

15 Due to excellent activity, the compounds of formula I may be used in cultivation of all plants where infection by phytopathogenic fungi is not desired, e.g. cereals, solanaceous crops, vegetables, legumes, apples, vine.

20 The compounds according to formula I are superior through their valuable fungicidal properties, in particular their enhanced systemicity and enhanced fungicitoxy.

Moreover, the compounds I are suitable for controlling harmful  
25 fungi such as *Paecilomyces variotii* in the protection of materials (e.g. wood, paper, paint dispersions, fibers and tissues) and in the protection of stored products.

The compounds I are applied by treating the fungi, or the plants,  
30 seeds, materials or the soil to be protected against fungal infection, with a fungicidally active amount of the active ingredients. Application can be effected both before and after infection of the materials, plants or seeds by the fungi.

35 In general, the fungicidal compositions comprise from 0.1 to 95, preferably 0.5 to 90, % by weight of active ingredient.

When used in crop protection, the rates of application are from 0.01 to 2.0 kg of active ingredient per ha, depending on the nature  
40 of the effect desired.

In the treatment of seed, amounts of active ingredient of from 0.001 to 0.1 g, preferably 0.01 to 0.05 g, are generally required per kilogram of seed.

45 When used in the protection of materials or stored products, the rate of application of active ingredient depends on the nature of the field of application and on the effect desired. Rates of ap-

plication conventionally used in the protection of materials are, for example, from 0.001 g to 2 kg, preferably 0.005 g to 1 kg, of active ingredient per cubic meter of material treated.

- 5 For example, they can be used in agriculture or related fields for the control of phytopathogenic fungi such as *Alternaria solani*, *Botrytis cinerea*, *Cercospora arachidicola*, *Cercospora beticola*, *Cladosporium herbarum*, *Cochliobolus miyabeanus*, *Corticium rolfsii*, *Erysiphe graminis*, *Erysiphe cichoracearum* und *Sphaero-*  
10 *theca fuliginea*, *Fusarium*-species, *Erysiphe cichoracearum*, *Helminthosporium tritici repentis*, *Leptosphaeria nodorum*, *Micronec-triella nivalis*, *Monilinia fructigena*, *Mycosphaerella ligulicola*, *Mycosphaerella pinodes*, *Phytophthora infestans*, *Plasmopara viti-*  
15 *cola*, *Pseudocercospora herpotrichoides*, *Puccinia*-species, *Py-ricularia oryzae*, *Rhizoctonia solani*, *Sclerotinia sclerotiorum*, *Sphaerotheca fuliginea*, *Uncinula necator* and *Venturia inequalis*. The compounds of formula I according to the Invention possess a high fungicidal activity within a wide concentration range.
- 20 The Invention further provides a fungicidal composition which comprises an active ingredient, which is at least one compound of formula I as defined above, and one or more carriers. A method of making such a composition is also provided which comprises bring-  
25 ing a compound of formula I as defined above into association with the carrier(s). Such a composition may contain a single ac-tive ingredient or a mixture of several active ingredients of the present Invention. It is also envisaged that different isomers or mixtures of isomers may have different levels or spectra of acti-vity and thus compositions may comprise individual isomers or  
30 mixtures of isomers.

A composition according to the Invention preferably contains from 0.5% to 95% by weight (w/w) of active ingredient.

- 35 A carrier in a composition according to the Invention is any ma-terial with which the active ingredient is formulated to facili-tate application to the locus to be treated, which may for exam-ple be a plant, seed, soil, or water in which a plant grows, or to facilitate storage, transport or handling. A carrier may be a  
40 solid or a liquid, including material which is normally a gas but which has been compressed to form a liquid.

- The compositions may be manufactured into e.g. emulsion concen-trates, solutions, oil in water emulsions, wettable powders, so-  
45 luble powders, suspension concentrates, dusts, granules, water dispersible granules, micro-capsules, gels, tablets and other formulation types by well-established procedures. These procedu-

res include intensive mixing and/or milling of the active ingredients with other substances, such as fillers, solvents, solid carriers, surface active compounds (surfactants), and optionally solid and/or liquid auxiliaries and/or adjuvants. The form of application such as spraying, atomizing, dispersing or pouring may be chosen like the compositions according to the desired objectives and the given circumstances.

Solvents may be aromatic hydrocarbons, e.g. Solvesso<sup>®</sup> 200, substituted naphthalenes, phthalic acid esters, such as dibutyl or dioctyl phthalate, aliphatic hydrocarbons, e.g. cyclohexane or paraffins, alcohols and glycols as well as their ethers and esters, e.g. ethanol, ethyleneglycol mono- and dimethyl ether, ketones such as cyclohexanone, strongly polar solvents such as N-methyl-2-pyrrolidone, or  $\gamma$ -butyrolactone, higher alkyl pyrrolidones, e.g. noctylpyrrolidone or cyclohexylpyrrolidone, epoxidized plant oil esters, e.g. methylated coconut or soybean oil ester and water. Mixtures of different liquids are often suitable.

Solid carriers, which may be used for dusts, wettable powders, water dispersible granules, or granules, may be mineral fillers, such as calcite, talc, kaolin, montmorillonite or attapulgite. The physical properties may be improved by addition of highly dispersed silica gel or polymers. Carriers for granules may be porous material, e.g. pumice, kaolin, sepiolite, bentonite; non-sorptive carriers may be calcite or sand. Additionally, a multitude of pre-granulated inorganic or organic materials may be used, such as dolomite or crushed plant residues.

Pesticidal compositions are often formulated and transported in a concentrated form which is subsequently diluted by the user before application. The presence of small amounts of a carrier which is a surfactant facilitates this process of dilution. Thus, preferably at least one carrier in a composition according to the invention is a surfactant. For example, the composition may contain at two or more carriers, at least one of which is a surfactant.

Surfactants may be nonionic, anionic, cationic or zwitterionic substances with good dispersing, emulsifying and wetting properties depending on the nature of the compound according to general formula I to be formulated. Surfactants may also mean mixtures of individual surfactants.

The compositions of the Invention may for example be formulated as wettable powders, water dispersible granules, dusts, granules, tablets, solutions, emulsifiable concentrates, emulsions, suspension concentrates and aerosols.

5

Wettable powders usually contain 5 to 90% w/w of active ingredient and usually contain in addition to solid inert carrier, 3 to 10% w/w of dispersing and wetting agents and, where necessary, 0 to 10% w/w of stabilizer(s) and/or other additives such as pe-

10 netrants or stickers. Dusts are usually formulated as a dust concentrate having a similar composition to that of a wettable powder but without a dispersant, and may be diluted in the field with further solid carrier to give a composition usually containing 0.5 to 10% w/w of active ingredient.

15

Water dispersible granules and granules are usually prepared to have a size between 0.15 mm and 2.0 mm and may be manufactured by a variety of techniques. Generally, these types of granules will contain 0.5 to 90% w/w active ingredient and 0 to 20% w/w of ad-

20 ditives such as stabilizer, surfactants, slow release modifiers and binding agents. The so-called "dry flowables" consist of relatively small granules having a relatively high concentration of active ingredient.

25 Emulsifiable concentrates usually contain, in addition to a solvent or a mixture of solvents, 1 to 80% w/v active ingredient, 2 to 20% w/v emulsifiers and 0 to 20% w/v of other additives such as stabilizers, penetrants and corrosion inhibitors. Suspension concentrates are usually milled so as to obtain a stable, nonse-

30 dimenting flowable product and usually contain 5 to 75% w/v active ingredient, 0.5 to 15% w/v of dispersing agents, 0.1 to 10% w/v of suspending agents such as protective colloids and thixotropic agents, 0 to 10% w/v of other additives such as defoamers, corrosion inhibitors, stabilizers, penetrants and stickers, and

35 water or an organic liquid in which the active ingredient is substantially insoluble; certain organic solids or inorganic salts may be present dissolved in the formulation to assist in preventing sedimentation and crystallization or as antifreeze agents for water.

Aqueous dispersions and emulsions, for example compositions obtained by diluting the formulated product according to the Invention with water, also lie within the scope of the Invention.

45

## 20

Of particular interest in enhancing the duration of the protective activity of the compounds of this invention is the use of a carrier which will provide slow release of the pesticidal compounds into the environment of a plant which is to be protected.

5

The biological activity of the active ingredient can also be increased by including an adjuvant in the spray dilution. An adjuvant is defined here as a substance which can increase the biological activity of an active ingredient but is not itself significantly biologically active. The adjuvant can either be included in the formulation as a coformulant or carrier, or can be added to the spray tank together with the formulation containing the active ingredient.

15 As a commodity the compositions may preferably be in a concentrated form whereas the end user generally employs diluted compositions. The compositions may be diluted to a concentration down to 0.001 % of active ingredient. The doses usually are in the range from 0.01 to 10 kg a.i./ha.

Example 13 Preparation of 5-chloro-7-n-hexyl-6-(2,4,6-trifluorophenyl)-pyrazolo[1,5-a]pyrimidine

Copper iodide (5 mmol) was suspended in THF (25 ml) under an inert gas atmosphere. The suspension was cooled to -70°C and n-hexyllithium (5 ml, 2M in hexanes) was added by syringe. The mixture was stirred for 45 minutes and 5,7-dichloro-6-(2,4,6-trifluorophenyl)-pyrazolo[1,5-a]pyrimidine (5 mmol, obtained from Example 3) was added as a solution in THF (10 min). The reaction mixture was stirred for 15 minutes at -70°C. The reaction mixture was then quenched with a mixture of aqueous saturated ammonium chloride/concentrated ammonia (9:1). The two phase mixture was separated. An oil was isolated from the organic layer which was subjected to chromatographic purification which yields the product as a crystalline residue.

### 30 Biological Investigations

Determination of Minimum Inhibitory Concentration by Test Compounds in the Serial Dilution Test with *Pyricularia Orvzae*

35 The MIC (Minimum Inhibitory Concentration) value, which indicates the lowest concentration of the active ingredient in the growth medium which causes a total inhibition of mycelial growth, is determined by serial dilution tests using Microtiter plates with 24 or 48 wells per plate. The dilution of the test compounds in the nutrient solution and the distribution to the wells is carried out by a TECAN RSP 5000 Robotic Sample Processor. The following test compound concentrations are used: 0.05, 0.10, 0.20, 0.39, 0.78, 1.56, 3.13, 6.25, 12.50, 25.00, 50.00 and 100.00 µg/ml. For preparation of the nutrient solution, V8 vegetable juice (333 ml) is mixed with calcium carbonate (4.95 g), centrifuged, the supernatant (200 ml) diluted with water (800 ml) and autoclaved at 121 °C for 30 min.

The inocula of *Pyricularia oryzae* are added into the wells as spore suspensions (50  $\mu$ l;  $5 \times 10^5$ /ml) or agar slices (6 mm) of an agar culture of the fungus.

- 5 After 6-12 days incubation at suitable temperatures (18-25°C), the MIC values are determined by visual inspection of the plates (Table III).
